Egg pendulum project

Our idea was to put as many offensive and defensive features on our car as possible. Our main offensive part was the hammer and nails on front of our car because most cars only had frontal defenses so the hammer would come down on top of the other egg. We also made the car as heavy as possible to crush the other car. Our defensive features included our wooden frame and central body suspended by bungees.

If given the chance to rebuild the car I would make the frame out of a thinner and smaller wood. This would maintain the strong body and allow us to put more weight on the hammer.
